Anthurium luteynii Croat, Selbyana 5(3–4): 324. 1981. TYPE: Panama. Veraguas: Río Primero Brazo, 2.5 km beyond Escuela Agrícola Alto Piedra, beyond Santa Fe, 700–750 m, *Croat 25521* (holotype, MO 2827506-08; isotypes, B, C, CAS, CM, CR, DUKE, F, K, M, MEXU, NY, PMA, SEL, UCLA, US, VEN). Figures 18, 187–189, 195.

Epiphytic or terrestrial; stem short; roots descending, whitish green, smooth to weakly pubescent, blunt at apex, 2–5 mm diam.; cataphylls subcoriaceous, elliptic, 10–28 cm long, minutely apiculate and inequilateral at apex, drying tan, persisting intact, soon dilacerating into reticulum of fibers. Leaves erect to spreading; petioles 9–50 cm long, 1.3–2.5 cm diam., ± trapezoidal to thicker than broad, flattened to weakly sulcate, sometimes with weak rib diminishing toward the base adaxially, the margins prominently and sharply raised, sharply and prominently 1–3-ribbed abaxially, the surface minutely pale-speckled; geniculum much thicker and paler than petiole, 1–3 cm long; blades thickly coriaceous, oblong-elliptic to oblong-ob lanceolate, gradually to abruptly acuminate at apex (the acumen apiculate), acute to obtuse at base, 50–125 cm long, 9–33 cm wide, broadest near or above the middle; upper surface

weakly glossy to semiglossy, dark green, lower surface matte, paler; midrib flat at base, becoming convexly raised toward the apex, much paler than surface above, prominently higher than broad and sharply 1–3-ribbed at base below, gradually becoming prominently and obtusely to acutely angular and eventually convex toward the apex, paler than surface; primary lateral veins 10–25 per side, departing midrib at 60–70° angle, slightly arcuate-ascending, weakly raised in grooves above, narrowly and convexly raised below; interprimary veins sunken above, flat or slightly raised and darker than surface below; tertiary veins obscure above, darker than surface below; collective vein arising from near the base, sometimes in the upper third of the blade, sunken or ± obscure above, weakly raised to flat and darker than surface below, 3–10 mm from margin. Inflorescences erect-spreading and slightly arching, equaling or shorter than leaves; peduncle 49–85 cm long, 1.3–2 cm diam., 0.5–3(6.6)× as long as petiole, green to violet-purple, with prominent rounded rib adaxially, more prominently ribbed abaxially; spathe erect to culculate, hooding the spadix, coriaceous, dark purple, narrowly ovate to oblong-lanceolate, 9–33.5 cm long, 2–11 cm wide, broadest in the lower third, inserted at 60° angle on peduncle, acuminate at apex (the acumen caudate, to 15 mm long), decurrent at base; spadix violet-purple to maroon, shortly tapered toward apex (occasionally toward both ends), 7–18 cm long, 8–28 mm diam. near base, 5–17 mm diam. near apex; flowers rhombic to slightly 4-lobed, 2–3.6 mm long, 1.8–3 mm wide, the sides straight to jaggedly sigmoid; ca. 15 flowers visible in either spiral; tepals matte to semiglossy, minutely punctate, covered with dust-like waxy bloom; lateral tepals 1.2–1.5 mm wide, the inner margins turned up against pistil; pistils exserted ca. 0.5 mm, green at base, purplish brown at apex; stigma 1 mm long, droplets copious, appearing 3–4 weeks before stamens emerge; stamens emerging in a scattered pattern throughout spadix, lateral stamens emerging to apex before alternates start emerging; anthers creamy, 0.4–0.5 mm long, 0.6–1 mm wide; thecae ellipsoid, slightly bivaricate; pollen yellow-orange fading to white. Infructescence erect or spreading; spathe culculate and withered; spadix 20–25 cm long, to 4 cm diam.; berries orange to yellow (B & K yellow 8/25), oblong-ellipsoid to obovoid, acute at apex, 8.9–19 mm long, 5–8 mm diam.; pericarp thickened, transparent in lower half with few raphide cells; mesocarp mealy, orange; seeds 2 per berry, tan, oblong, 4–6.5 mm long, 2–2.7 mm diam., ca. 2 mm thick, weakly beaked at both ends.

Anthurium luteynii is known only from Panama, on both slopes of the Continental Divide, in tropical wet and premontane rainforest life zones at elevations of 530 to 1,350 m.

This species is characterized by its coriaceous, more or less narrowly oblanceolate leaves and its somewhat trapezoidal petiole that is prominently three-ribbed abaxially and sharply sulcate adaxially. Also characteristic is the stout, semi-erect inflorescence with a broad, often cucullate, purplish spathe and violet-purple spadix and the long, sharply pointed, orange berries.

Although initially confused with *Anthurium sebertii* because of its orange, pointed berries and coriaceous, persistent, intact cataphylls, *A. luteynii* is not believed to be closely related to that species or to any other known species. *Anthurium sebertii* differs from *A. luteynii* principally in having thinner, strap-shaped leaves with the collective vein always arising from near the base, and in having a narrowly tapered, much paler violet-purple spadix.

PANAMA. BOCAS DEL TORO: Fortuna Road, Gualaca-Chiriquí Grande, 33 km from Gualaca, 530 m, 8°36'N, 82°19'W, Hoover 1334 (MO).
